

# DATA CENTERS

## FAST FACTS

Data centers are where the internet is stored. Whether its online shopping, a social media post, or advanced Artificial Intelligence, that information is put on a server and accessed by your device whenever you need it!

**However, data centers are extremely wasteful and without careful planning they harm the communities they reside in**

Can take up **ACRES** of land but only provide around **30 jobs** per center after initial construction. **(that's less than your average McDonalds)**

Their water use can exceed the total quota for an entire city or municipality. Localities may be unable to handle the increased demand.

They often require construction of new power transmission lines or substations. This puts a strain on the electric grid and drives up our utility bills!

# WE NEED DATA CENTER TRANSPARENCY!
